TOR CDR

Radiography Phantom

A routine test object designed to be used quickly and easily on a regular basis (e.g. weekly or monthly) to provide an ongoing check of imaging performance, particularly those aspects which are most liable to deterioration. After an initial grey-scale check, image quality is measured simply by counting the number of details detected and the number of bar-patterns resolved in the image. An ongoing record of these numbers will reveal any trend towards deterioration in imaging performance.

Used for conventional and non-subtractive digital radiography, TOR CDR enables the following checks to be made:

- Sensitometric measurements
 (10 test point details, 5.6mm diameter)
- Resolution limit (0.5 to 14.3 LP/mm)
- Low-contrast large-detail detectability (17 details, 11mm diameter, contrast range 0.002 to 0.075 @ 70kVp 1mm Cu)
- High-contrast small-detail detectability (17 details, 0.5mm diameter, contrast range 0.039 to 0.954 @ 70kVp 1mm Cu)

In addition to checking the consistency of radiographic performance, the test object can be used to assess the relative performance of different screenfilm combinations.
